

EC114 – INTRODUCTION TO QUANTITATIVE ECONOMICS

Test No. 2
8-12-2005

Do not turn this sheet over until given permission to do so.

Time allowed: 45 minutes

Instructions:

1. fill in the cover of your answer sheet
2. answer **all** of your questions
3. use of calculators is permitted (make sure to write down your calculations)
4. **Do not** leave your seat before the end of the test and until **all** papers have been collected.

BE SURE TO SHOW ALL YOUR WORKING

1- Assume X is $N\sim(10, 4)$. Find:

a) $\Pr(X > 13.4)$, (5 marks)

b) $\Pr(8 < X < 9)$, (5 marks)

c) if $Y = 2X + 10$, what can you say about the distribution of Y ? (10 marks)

2- 18 of a random sample of 200 members of the male workforce are found to be unemployed. Obtain a 95% confidence interval for the economy-wide male rate of unemployment and interpret your results. (20 marks)

3- It is claimed that the mean retail price per litre of unleaded petrol now exceeds 90p. A random sample of 70 service stations yields a mean price of 91.5p with a standard deviation of 2.3p.

a) to test the claim construct, carefully, appropriate null and alternative hypotheses and hence derive a suitable test statistic. (15 marks)

b) using a 0.01 level of significance, define your test criterion and test whether the claim is justified. (15 marks)

4- A variable X has a mean $\mu = 35$ and a variance $\sigma^2 = 144$. An investigator is unaware that $\mu = 35$ but knows that $\sigma^2 = 144$. He takes a sample of size $n = 64$ and tests $H_0 : \mu = 30$ against $H_A : \mu > 30$, using a 0.05 level of significance.

a) considering \bar{X} as the sample mean, state the suitable test statistic and define your test criterion; (10 marks)

b) find the probability of a type I error; (10 marks)

c) find the probability of a type II error. (10 marks)
